While Ichimoku is a well-known and widely used tool, there are many hidden strategies that can unlock even more potential for traders. These strategies are not commonly shared, but they can give traders a significant edge in the markets.

In this article, we will reveal 11 of the best Ichimoku strategies that no one tells you about. These strategies are easy to implement and can be used by traders of all levels of experience. By mastering these strategies, you will be able to:

- Identify high-probability trading opportunities
- Manage risk more effectively
- Increase your trading profits

Ready to take your trading to the next level? Let's dive into these hidden Ichimoku strategies.

1. The Tenkan-Kijun Cross

The Tenkan-Kijun Cross is a simple but effective strategy that identifies potential trend reversals. It is formed when the Tenkan-sen (9-period moving average) crosses the Kijun-sen (26-period moving average).

THE #1 TIP PROFESSIONAL TRADERS DON'T WANT YOU TO KNOW

When the Tenkan-sen crosses above the Kijun-sen, it is a bullish signal that indicates that a trend reversal is likely to occur. Conversely, when the Tenkan-sen crosses below the Kijun-sen, it is a bearish signal that indicates that a trend reversal is likely to occur.

2. The Chikou Span

The Chikou Span is a lagging indicator that shows the closing price of a security 26 periods ago. It is used to identify potential support and resistance levels and to confirm trend changes.

When the Chikou Span is above the price action, it indicates that the trend is bullish. Conversely, when the Chikou Span is below the price action, it indicates that the trend is bearish.

3. The Kumo Cloud

The Kumo Cloud is a visual representation of the Ichimoku indicator. It is formed by the Tenkan-sen, Kijun-sen, Senkou Span A, and Senkou Span B.

The Kumo Cloud can be used to identify potential support and resistance levels, as well as to determine the strength of a trend.

4. The Ichimoku Oscillator

The Ichimoku Oscillator is a momentum indicator that measures the difference between the Tenkan-sen and the Kijun-sen. It is used to identify potential trading opportunities and to confirm trend changes.

When the Ichimoku Oscillator is above the zero line, it indicates that the trend is bullish. Conversely, when the Ichimoku Oscillator is below the zero line, it indicates that the trend is bearish.

5. The Relative Strength Index (RSI) and Ichimoku

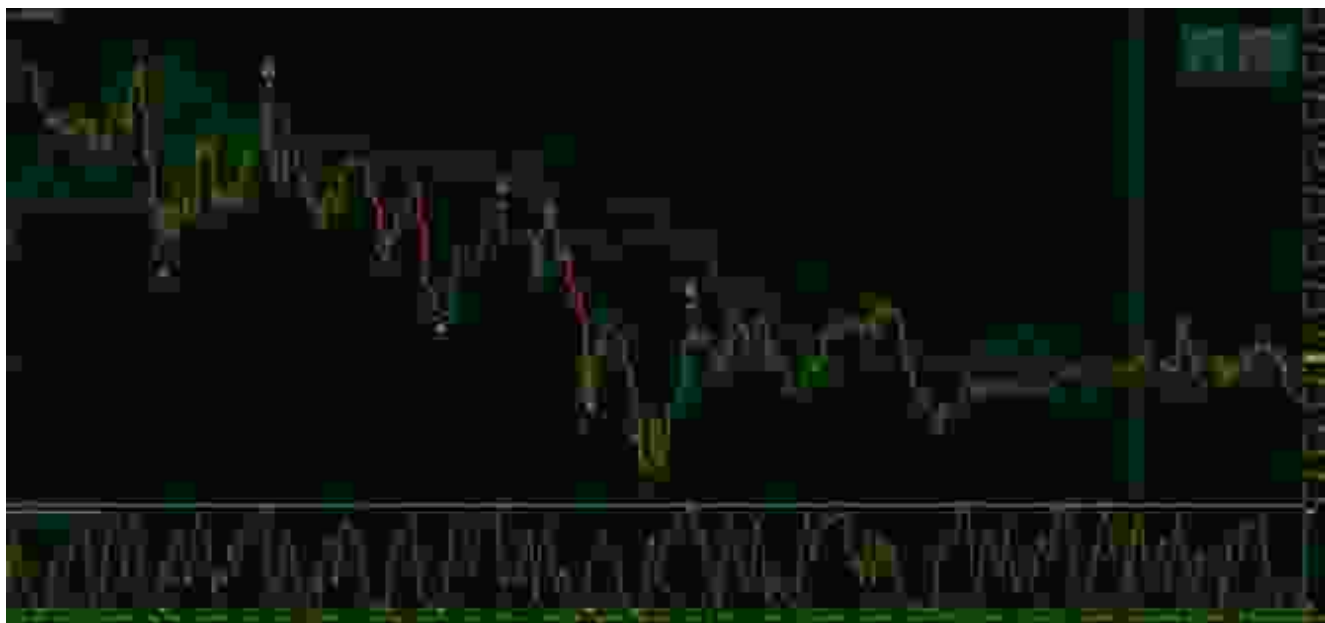

The Relative Strength Index (RSI) is a momentum indicator that measures the magnitude of recent price changes. It is used to identify potential trading opportunities and to confirm trend changes.

When the RSI is above the 70 level, it indicates that the security is overbought and that a correction is likely to occur. Conversely, when the RSI is below the 30 level, it indicates that the security is oversold and that a rally is likely to occur.

6. The Stochastic Oscillator and Ichimoku

The Stochastic Oscillator is a momentum indicator that measures the relationship between the closing price of a security and its high and low prices over a period of time. It is used to identify potential trading opportunities and to confirm trend changes.

When the Stochastic Oscillator is above the 80 level, it indicates that the security is overbought and that a correction is likely to occur. Conversely, when the Stochastic Oscillator is below the 20 level, it indicates that the security is oversold and that a rally is likely to occur.

7. The Moving Average Convergence Divergence (MACD) and Ichimoku

The Moving Average Convergence Divergence (MACD) is a trend-following momentum indicator that measures the relationship between two moving averages. It is used to identify potential trading opportunities and to confirm trend changes.

When the MACD line crosses above the signal line, it indicates that a bullish trend is likely to occur. Conversely, when the MACD line crosses below the signal line, it indicates that a bearish trend is likely to occur.

8. The Bollinger Bands and Ichimoku

Bollinger Bands are a volatility indicator that measures the relationship between the price of a security and its moving average. They are used to identify potential trading opportunities and to confirm trend changes.

When the price of a security is above the upper Bollinger Band, it indicates that the security is overbought and that a correction is likely to occur. Conversely, when the price of a security is below the lower Bollinger Band, it indicates that the security is oversold and that a rally is likely to occur.

9. The Fibonacci Retracement and Ichimoku

The Fibonacci Retracement is a technical analysis tool that identifies potential support and resistance levels. It is based on the Fibonacci sequence, which is a series of numbers that occur naturally in many different areas of life.

The Fibonacci Retracement levels can be used to identify potential areas where the price of a security is likely to retrace after a trend reversal.

10. The Elliott Wave Theory and Ichimoku

The Elliott Wave Theory is a technical analysis tool that identifies patterns in the price action of a security. It is based on the idea that the price of a security moves in a series of waves, which can be used to predict future price movements.

The Elliott Wave Theory can be used to identify potential trading opportunities and to confirm trend changes.

11. The Ichimoku Cloud and Price Action

The Ichimoku Cloud can be used to identify potential trading opportunities by combining it with price action analysis. Price action analysis is the study of the price movements of a security without the use of indicators.
